Single Hygienic Quarter Turn for All Enclosure Door Sizes

Designed for Extreme Indoor and Outdoor Locations - Type: 4X, IP69K, IP69 and IP66

The primary reason water gets into an electrical enclosure is "*people simply do not turn all the quarter turns*", which is paramount in keeping electrical equipment dry. Our innovation provides a Single Hygienic Quarter Turn door for every enclosure we manufacturer!

Our vision was to take more responsibility to ensure every enclosure door we manufactured is being closed properly in the field. We accomplished this by redesigning our enclosures so only one quarter turn is required to keep even our largest 80" high X 36" wide door sealed.

SINGLE HYGIENIC QUARTER TURN FOR ALL ENCLOSURE DOOR SIZES!

We first had to modify our hygienic quarter turn by adding extended flats so that a standard crescent wrench or open-ended box wrench could be used. We then redesigned the doors so one hygienic quarter turn with a 3-point cam and its interlocking rod assembly would be able to keep the door sealed properly.

We are currently the only manufacturer in North America that manufactures all its enclosure door sizes with a single quarter turn while maintaining washdown ratings of:

 **US LISTED Type: 4X, 4, 3R and IP ratings of IP66, IP69 and IP69K**

By keeping our enclosures dryer, this simple but very effective design change:

- Reduces premature electrical failures
- Increases plant production
- Increases plant revenue
- Reduces overall cost of equipment ownership!
